

## REMARKS

Claim 7 has been amended to call for the control to be between the buttons and the second end. The buttons are claimed to be on an upper surface having a pair of opposed first and second ends. The buttons are closer to the first end than the second end and the control is positioned between the buttons and the second end along the edge between the upper surface and the bottom surface.

In the cited reference, the control 80 is alongside the buttons 42 and is not on the top surface between the buttons and the edge farther from the edge adjacent the buttons.

Therefore, the rejection should be withdrawn.

New claim 16 is worded differently, but should be patentable for the same reason as claim 7.

Respectfully submitted,

Date: March 13, 2008
